Gatekeeper case study

Publication status: BLOCKED · HUMAN APPROVAL REQUIRED.

This deterministic, source-linked draft uses only the project library. It is not an autonomous LLM-generated claim of fact.

Scope and safeguards

An on-premises, AI-assisted alert workflow using existing camera feeds, with human review. The MSA requires anonymisation, source review, and written approval from Legal and Corporate Communications. No faces, plant images, locations below country level, capacity, headcount, or client branding should be published without approval.

Evidence and risk review

- PPE compliance reached 91.1% in the final pilot period. (SUPPORTED; Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)
- Restricted-zone breach rate fell by approximately 46.24%. (SUPPORTED; Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)
- The pilot achieved a 50% restricted-zone reduction. (CONFLICTING; Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)
- The pilot delivered face recognition. (CONFLICTING; Project_Drishti_Library/01_contract/MSA_confidentiality_and_publicity_extract.md)

Known limitations: The restricted-zone reduction target was missed.; Acknowledgement remained above target and is reported as a proxy.; Financial savings and causal safety outcomes are not established.; Face recognition was removed for legal and privacy reasons.

Release decision

Do not publish until the approval sheet is signed and every number and media asset has been reviewed.
