User case study

Publication status: BLOCKED · HUMAN APPROVAL REQUIRED.

This deterministic, source-linked draft uses only the project library. It is not an autonomous LLM-generated claim of fact.

The operational problem

Safety teams needed a consistent way to review PPE and restricted-zone events in daily operations.

How the workflow worked

The on-premises pilot used existing cameras to raise alerts for human review. Face recognition was not delivered. The pilot ran from 11 May to 3 July 2026 across 40 cameras.

Measured results

- PPE compliance: 68.88 · 91.08 % (met; target >= 90%; source: Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)
- Restricted-zone breach rate: 5.58 · 3.0 breaches / 1,000 camera-hours (missed; target 50% reduction; source: Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)
- False alarm rate: not established · 9.68 % (met; target < 10%; source: Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)
- Alert acknowledgement proxy: not established · 4.9 minutes (missed; target <= 3 minutes; source: Project_Drishti_Library/04_delivery/pilot_acceptance_certificate_2026-07-06.md)

Lessons and limitations

- The restricted-zone reduction target was missed.
- Acknowledgement remained above target and is reported as a proxy.
- Financial savings and causal safety outcomes are not established.
- Face recognition was removed for legal and privacy reasons.
